

RISK
QUILT

Risk management that people actually use

Most tools make compliance admin faster. RiskQuilt helps you make better risk and control decisions — so the controls you run are the right ones, and cheaper to prove.

Built to be used

RiskQuilt supports a full enterprise risk model — financial, operational, compliance and technology risk as peers — while supporting the workflows of technology teams, where controls, certifications and audits are densest.

Good risk management is a matter of culture more than software: the judgement sits with the people closest to the risk. The platform's job is to help them make that judgement well, and to explain it afterwards.

Most risk tools fail the same way: one person buys the platform, it is configured for months, and everyone else quietly goes back to their spreadsheets. RiskQuilt is built for the people who live with the risks — and when they use it, everyone above them gets complete data and an audit trail worth having.

Built for the people who own the risks

Risk owners, control owners and department heads manage risk as part of a real job. Each person sees what their task needs; the rest stays out of the way.

Unlimited users, published pricing

Every tier includes unlimited users — better data comes from more people contributing, so we never charge per seat. Pricing is published, with no wall between you and the number.

Guidance where you might otherwise get stuck

Short practitioner videos shown in context, for example: how to write a risk, how to score without emotion, how to define a control you can defend to an auditor.

Works with your own AI

Connect the AI your organisation already uses to live risk data through the open MCP standard supported by all major models. No new AI vendor to assess, and your data never touches our AI infrastructure.

One platform, every risk domain

CORE RISK MODEL

Risk

Configurable scoring, appetite, parent and child risks, full change history.

Action

Treatment attached to the risk or control that prompted it, tracked to closure.

Obligation

Import any compliance framework from CSV or author your own, then map controls to it.

Control

Define in audit friendly terms and capture both self and independent effectiveness assessments.

Event

Capture an incident as it unfolds; close it with lessons attached. Link to controls and risks to embed learning.

MAKE BETTER DECISIONS

Reporting

Heatmaps and appetite roll-up by domain, with board packs from live data.

Education

Practitioner how-to videos, on the screen where you would otherwise stall.

AI integration

Connect Claude, ChatGPT, Gemini or any MCP tool to your live risk data.

FIT TO YOUR BUSINESS

Configuration

Scoring scales, impact tables, appetite and categories, set to your framework.

Permissions and access

Your own single sign-on, with granular permissions that inherit down the tree.

Governance and sign-off

Approval on closures and assessments — you decide what needs a second pair of eyes.

See it working

Published pricing and a one-month free trial at riskquilt.com/pricing. Or explore the live sandbox first — sample data, no signup, resets every couple of hours: riskquilt.com/demo
